EXTERIOR Architectural Panel System

LIGHTWEIGHT

FINA Natural Stone, Porcelain and Engineered Quartz panels weigh about 3.5 pounds per square. The reduction in weight saves cost on structural back requirements, installation equipment and installation labor. Perfect for interior remodel and new construction, panels can be installed over an existing substrate eliminating the need for demolition.

DURABLE

FINA panels are constructed with a lightweight structural honeycomb backer, providing outstanding flexural strength and are 60-times more impact resistant, making them practically indestructible. Long lasting and durable, our panels are independently tested to meet required US building codes.

DESIGN WITH COLOR & STYLE

With hundreds of color and style options to choose from, FINA panels offer you an unlimited design pallet. We can process large panel sizes up to 6' x 10' and will cut to size per your project requirements.

FABRICATION & INSTALLATION

Lightweight natural stone panels have been installed on building exteriors in the US for more than 36 years. Fabricated returns provide the look of dimensionally thick material without the weight. Panels install easily with our integrated connection systems.
